Therefore, compared with case 1 without power sharing, the operating cost is reduced by 14.8 %. In the process of power sharing in Case 3, EVs are also considered as a mobile shared energy storage for electrical energy interaction with the building, the running cost decreased by 13.66 % compared to case 2.

In contrast, mobile storage only discharges energy on demand, and can do so instantly; they don't need to idle at all. This can dramatically lower energy costs, especially combined with their ability to charge off-peak at 10-15 cents per kWh. Beyond fuel savings, mobile storage batteries require much lower maintenance than diesel generators.
