A hydraulic accumulator is a part of a hydraulic system that stores the energy created by the pressure on the hydraulic fluids. Hydraulic accumulators are used as pressure storage reservoirs. They contain hydraulic fluid, and this fluid is pressurized with an external source. A hydraulic accumulator is a component of a hydraulic system.

Parker hydraulic accumulators regulate the performance of a hydraulic system by providing an additional volume of system fluid, pressurised by an external gas supply. For industrial applications, Parker offers three types of hydro-pneumatic accumulators: piston, bladder and diaphragm. Each type has particular advantages and limitations which ...

In case of failure of the main energy source, these accumulators can provide sufficient energy to complete an operation or to realize a full hydraulic cycle: Hydraulic Spring/Shock Absorber : A bladder accumulator can act as a gas spring suppressing shocks and vibrations in hydraulic systems of lifting vehicles (e.g. Forklift trucks) and ...

ASPlight. Determine the key parameters for selecting the optimal hydraulic accumulator for your field of application in just a few clicks. Our online tool ASPlight calculates the required variables, such as accumulator volume, pressure ratio and maximum and minimum operating pressures, taking into account real gas behaviour.
