This is an UPDATE, not a SELECT, so the FROM clause is incorrect. Also, the semicolon should go at the end of the last line. UPDATE products SET price = price*1.1; <== Remove the semicolon from products <== remove this line where prod_name like "HP%" <== add a semicolon at the end of this line

Here is a MySQL query which'll serve your purpose. To update _regular_price. UPDATE `wp_postmeta` SET `meta_value` = ROUND(`meta_value` * 1.40, 2) WHERE meta_key = "_regular_price" AND `post_id` IN (SELECT `object_id` AS product_id FROM `wp_term_relationships` WHERE term_taxonomy_id = 376 AND `object_id` IN (SELECT `ID` ...

I have a product Where it has different sizes and the price change depends on the sizes for example product table (Size: S) and the (Price: 50\$) but the (Size: L) has the (Price: 100\$). But it doesn't have the color variant. The products will not be inserted by us but by some sellers. The colors and sizes will be all choices in a dropdown-menu.

MySol products and prices

I have another table products, this is where I get the productId from: products: id (=productId in productPrice), name, url I would like to select * from products and use the productId to join the result with the latest price and the average price, to get a result for all products like: id,name,url,unixTime,price,avg

I am developing a generic e-commerce solution using a relational database (MySQL), and I want to manage products like this: Each product (e.g. wood, plastic, steel) will have several attributes (e.g. thickness, width, height, color).; In turn, each attribute can have several values (e.g. 3 mm or 5 mm for thickness, blue or red for color, etc.), which have a ...

Hey You can get answer by following query. `SELECT product_base1.product_id ID, product_base1.product_name NAME, product_base1.base1_count Base1_count, product_base1.base1_price Base1_SumPrice, COUNT(b2.id) Base2_count, SUM(b2.price) Base2_SumPrice FROM (SELECT p.id product_id, p.name product_name, COUNT(b.id) ...`

3 days ago MySQL is an open source relational database management system that is based on SQL or Structured Query Language helps to organizing your business data in an orderly manner is highly popular, reliable and fast tool for accessing, editing and monitoring database content. The software enables multiple users to enjoy free access to diverse databases. This ...

```
` SELECT YEAR(o.date_purchased) AS PurchaseYear, SUM(sub.ptotal - jp.fund + jp arge) AS feeship_total FROM orders o LEFT JOIN orders_total ot ON o.order_id = ot.order_id LEFT JOIN void jp ON jp.order_id = jp.oid INNER JOIN ( SELECT op.order_id, SUM(p.products_price * op.quantity) as ptotal FROM products p LEFT JOIN order_products ...
```

Change THEN 1 with THEN products.price in order to aggregate price values. Also, if you don't specify ELSE NULL, it will be by default NULL only.. `select customers.id as customerID, customers.last_name as customerLastName, SUM(CASE WHEN products.category_id = 10 THEN products.price END) AS "bags", SUM(CASE WHEN ...`

FOREIGN KEY (product_id) REFERENCES products(id), It is working. But now I have to record the price of the product when it was sold. The problem is that the product's price can be changed during the day for example: 29/01/2021 -> 43 apples were sold (Apple price: 1\$) 29/01/2021 -> 7 apples were sold (Apple price: 0.90\$)

```
SELECT SUM(price) AS total_price FROM products WHERE prod_name LIKE "HP%" or prod_name LIKE
```
