Many people see affordable storage as the missing link between intermittent renewable power, such as solar and wind, and 24/7 reliability. Utilities are intrigued by the potential for storage to meet other needs such as relieving congestion and smoothing out the variations in power that occur independent of renewable-energy generation.

Mechanical energy storage technologies such as megawatt-scale flywheel energy storage will gradually become mature, breakthroughs will be made in long-duration energy storage technologies such as hydrogen storage and thermal (cold) storage. By 2030, new energy storage technologies will develop in a market-oriented way.

However, in addition to the old changes in the range of devices, several new ESTs and storage systems have been developed for sustainable, RE storage, such as 1) power flow batteries, 2) super-condensing systems, 3) superconducting magnetic energy storage (SMES), and 4) flywheel energy storage (FES).

An increasing range of industries are discovering applications for energy storage systems (ESS), encompassing areas like EVs, renewable energy storage, micro/smart-grid implementations, and more. The latest iterations of electric vehicles (EVs) can reliably replace conventional internal combustion engines (ICEs).
