Today, it relies mainly on fossil fuels (oil, gas and coal) (Musa et al., 2018). Offshore oil and gas production is crucial to meet the world's rapidly growing energy demand. Since 2000, offshore oil and gas facilities have accounted for 30% and 27% of the world's oil and gas production respectively (Crivellari et al., 2021).

H<sub>2</sub> may become the primary energy source by 2050, replacing both natural gas and solid fuels. Long-term applications in the aviation and maritime sectors are anticipated, in addition to widespread usage in the transportation, metallurgical, and chemical industries [6]. H<sub>2</sub> is anticipated to be a key component of a CO<sub>2</sub>-neutral economy as well as worldwide ...
