At the same time, seawater is used as the operating medium, solving the problem of dependence of traditional pumped storage power stations on fresh water resources. Various countries have also conducted studies on the feasibility of site selection, impact of seawater corrosion, economic operation mode and environment, etc.

The pumped storage power station (PSPS) generates electricity by using the flowing water with a certain working head and pumps water by using external electric power [1], [2]. The PSPS is a kind of large-scale and efficient energy storage equipment. The operation and control of PSPS are regulated by the regulating system [3], [4].

1 Introduction. With significant growth of variable renewable generation on electric grids, the variability and uncertainty of these resources make it harder to manage supply and demand in different operation timescales - e.g. from 1 h to the next (ramping) and from 1 m to the next (frequency regulation/response) [] addition, the reduction of available rotating inertia ...
