

The energy and power densities are considered as the most important factors for evaluating the energy storage ability of a device. The energy and power densities are regarded as the mixed results of specific capacitance and potential window. The Ragone plot with the relation between specific energy and specific power was shown in Fig. 7 (e) to ...

A two-step methodology is used where the demand of energy services is calculated first. This is used as input to the energy system model TIMES-Oslo that calculates the energy consumption. The development in useful energy demand (green box) is calculated as an activity (e.g. m²) multiplied by an indicator (e.g. kWh/m²).
