

The combined use of phase change materials (PCM) and thermal insulation in building envelopes could potentially further promote the building energy efficiency while avoiding overheating. This is evaluated in this paper by combining the use of expanded polystyrene and PCM gypsum board in the building envelope of a typical standalone Australian ...

Phase change materials (PCMs) are currently an important class of modern materials used for storage of thermal energy coming from renewable energy sources such as solar energy or geothermal energy. PCMs are used in modern applications such as smart textiles, biomedical devices, and electronics and automotive industry.

Biobased phase change materials in energy storage and thermal management technologies. Author links open overlay panel Galina Simonsen a, Rebecca ... biobased composite made of coconut oil PCM and impregnated in biochar showed promising properties for being used as an insulation material with a melting temperature of 24 °C and a melting ...

Research on phase change material (PCM) for thermal energy storage is playing a significant role in energy management industry. However, some hurdles during the storage of energy have been perceived such as less thermal conductivity, leakage of PCM during phase transition, flammability, and insufficient mechanical properties. For overcoming such obstacle, ...

Sensible heat (Fig. 1 a) is the simplest method to store thermal energy and consists of applying a temperature gradient to a media (solid or liquid) in order to accumulate or release heat. The most common material used to store energy as sensible heat is water. Moreover, certain materials based on common ceramics (cement, concrete, etc.), some ...

There is an increasing need to improve the energy efficiency of residential buildings all around the world. Providing thermal insulation to the external walls and ceilings is a common practice for this purpose. The combined use of phase change materials (PCM) and thermal insulation in building envelopes could potentially further promote the building energy ...

Thermal management has become a crucial problem for high-power-density equipment and devices. Phase change materials (PCMs) have great prospects in thermal management applications because of their large capacity of heat storage and isothermal behavior during phase transition. However, low intrinsic thermal conductivity, ease of leakage, and lack ...

In response to the challenges posed by high energy consumption and CO₂ emissions in the construction

Phase change energy storage material insulation

industry, thermal energy storage and insulation have become focal points of research in recent years [7, 8]. Thermal energy storage is characterized by high latent heat, high storage density, and low thermal fluctuations [9]. Phase change materials (PCMs), ...

The thermal conductivity of 0.04 W/(m·K) makes it a better thermal insulation material. Cheng et al. [74] proposed a one-step in-situ synthesis method to prepare cellulose nanocrystals (CNC) ... Based on the above, the application of cellulose aerogel materials in phase change energy storage has become a research focus.

This study investigates a hybrid thermal insulation system for subsea pipelines. The insulation system combines a traditional insulation material, Aerogel, with a phase change material (PCM), paraffin wax, for thermal energy storage to better regulate fluid temperatures and improve flow assurance for subsea pipelines.

Some natural materials undergo phase shifts, and they are endowed with a high inherent heat storage capacity known as latent heat capacity. These materials exhibit this behavior due to the considerable amount of thermal energy needed to counteract molecular when a material transforms from a solid to a liquid or back to a solid.

The use of phase change materials (PCMs) is an attractive method for energy storage and utilization in building envelopes. Here, shape-stabilized phase change materials (SS-PCMs) were prepared via direct adsorption using mesoporous silica (MS) with different pore diameters as the support matrix. The leakage properties, microstructure, chemical structure, ...

In the context of dual-carbon strategy, the insulation performance of the gathering and transportation pipeline affects the safety gathering and energy saving management in the oilfield production process. PCM has the characteristics of phase change energy storage and heat release, combining it with the gathering and transmission pipeline not only improves ...

Phase change materials (PCMs) having a large latent heat during solid-liquid phase transition are promising for thermal energy storage applications. However, the relatively low thermal conductivity of the majority of promising PCMs ($< 10 \text{ W/(m} \cdot \text{K)}$) limits the power density and overall storage efficiency.

Polyurethane (PU) foam is most commonly used in thermal insulation in cold storage applications whereas it lacks thermal energy storage characteristics. In the present work, a phase-changing material n-pentadecane is microencapsulated with poly (methyl methacrylate-co-methacrylic acid) using oil in water (O/W) emulsion polymerization followed by the ...

Innovative building materials by upcycling clothing waste into thermal energy storage matrix with phase change materials. Author links open overlay panel Dongchan Jin a, Ji Yong Choi a, Jihee Nam a, Hyeonseong Yuk a ... thermal conductivities similar to commercial insulation materials were observed, registering an average of 0.0592 W/m³·K at 20 ...

Phase change energy storage material insulation

Valorization of coconut peat to develop a novel shape-stabilized phase change material for thermal energy storage. 2024, Journal of Cleaner Production ... Phase change material, thermal insulation, or their combination to meet zero-carbon-ready buildings? Journal of Cleaner Production, Volume 367, 2022, Article 133032 ...

The composite phase change insulation layer can extend the thermal spreading time of the module indefinitely and achieve the effect of zero spreading of thermal runaway. It is because the phase change material in the composite phase change insulation layer absorbs the thermal generated by the thermal runaway battery.

The use of phase change materials (PCMs) has become an increasingly common way to reduce a building's energy usage when added to the building envelope. This developing technology has demonstrated improvements in thermal comfort and energy efficiency, making it a viable building energy solution. The current study intends to provide a ...

The materials used for the preparation were purchased from Shenzhen Runyou Chemical Co., Ltd. The phase-change temperature and enthalpy of CA and PA during melting and solidification are shown in Table 1. The setting time, compressive strength and thermal conductivity of de-sulfurized gypsum are shown in Table 2. In this study, the mass ratio of CA ...

Phase change materials (PCMs) have been envisioned for thermal energy storage (TES) and thermal management applications (TMAs), such as supplemental cooling for air-cooled condensers in power plants (to obviate water usage), electronics cooling (to reduce the environmental footprint of data centers), and buildings. In recent reports, machine learning ...

Energy security and environmental concerns are driving a lot of research projects to improve energy efficiency, make the energy infrastructure less stressed, and cut carbon dioxide (CO₂) emissions. One research goal is to increase the effectiveness of building heating applications using cutting-edge technologies like solar collectors and heat pumps. ...

Pure hydrated salts are generally not directly applicable for cold energy storage due to their many drawbacks [14]. Usually, the phase change temperature of hydrated salts is higher than the temperature requirement for refrigerated transportation [15]. At present, the common measure is to add one or more phase change temperature regulators, namely the ...

In conclusion, the composite energy storage pipeline with PCM was used for oil transportation process, and the heat transfer model required for its thermal insulation performance evaluation includes multiple complex physical processes such as latent heat treatment of phase change of crude oil and PCM, coupling effect of multi-layer materials ...
