Which planets will be visible on November 17 & 20?

On November 17, the 98%-illuminated Moon and Jupiter (mag -2.8) will meet in the constellation Taurus. The planet will rise in the evening and will be visible to the naked eye. On November 20, the 77%-illuminated Moon and Mars (mag 0.2) will meet in the constellation Cancer. The planet will rise in the evening and will be visible to the naked eye.

Is a bright object near the Moon a star or a planet?

A bright object near the Moon can be a star or a planet. You can tell the difference by checking if the object twinkles. If it does, then it's a star; if not, it's a planet. Also, Jupiter and Venus (sometimes Mars and Saturn, too) are way brighter than most stars.

Which planets are currently visible?

See which planets are currently visible, along with their rise and set times, to help you plan your observations. Jupiter presents a captivating view with its prominent cloud bands, the iconic Great Red Spot, and up to four of its largest moons: Io, Europa, Ganymede, and Callisto.

Where can I see the Moon on October 28 & 29?

To see a precise view - and time - from your location, try Stellarium Online. Chart via EarthSky. On the mornings of October 28 and 29, the thin waning crescent moon hangs above the eastern horizon near Denebola, the end star of the tail of Leo of Lion. The dark portion of the moon will be glowing with earthshine.

3 days ago; Here are a few tips to identify planets in the night sky: Tip 1: Planets are not visible anywhere in the sky. They are visible along the ecliptic. The ecliptic is the path of the sun across the sky. So notice carefully where the sun rises, along which path it moves during the day and where it sets. Planets are visible along this path at night.
