

# Planets in solar system by size

What are the smallest planets in our Solar System?

Planets in our Solar system size comparison. Largest to smallest are pictured left to right, top to bottom: Jupiter, Saturn, Uranus, Neptune, Earth, Venus, Mars, Mercury. Via Wikimedia Commons. If you're interested in planets, the good news is there's plenty of variety to choose from in our own Solar System.

What are the smallest and largest planets in order?

The size of the planets in order from smallest to largest is Mercury, Mars, Venus, Earth, Neptune, Uranus, Saturn, and Jupiter. The size of planets in our solar system varies dramatically. Let's explore the sizes of the planets, including their radius and diameter in both kilometers and miles, and their relative sizes compared to Earth.

How many planets are in our Solar System?

According to NASA, this is the estimated radii of the eight planets in our solar system, in order of size. We also have included the radii sizes relative to Earth to help you picture them better. Eight planets and a dwarf planet in our Solar System, approximately to scale. Pluto is a dwarf planet at far right. At far left is the Sun.

How big is a planet compared to the Earth?

When it comes to their measurable sizes in diameter, the planets vary greatly. Jupiter, for example, is approximately 11 times the diameter of the Earth. Mercury, on the other hand, is 2.6 times smaller in diameter than the Earth. Below you will find a list of the planet's mean diameters from largest to smallest.

What are the approximate sizes of the planets relative to each other?

This illustration shows the approximate sizes of the planets relative to each other. Outward from the Sun, the planets are Mercury, Venus, Earth, Mars, Jupiter, Saturn, Uranus, and Neptune, followed by the dwarf planet Pluto. Jupiter's diameter is about 11 times that of the Earth's and the Sun's diameter is about 10 times Jupiter's.

Which planets are in order from the Sun?

In order from the Sun, the inner planets are Mercury, Venus, Earth, and Mars: Mercury - The smallest planet in our solar system, Mercury's radius is about 2,440 km (1,516 mi), making its diameter roughly 4,880 km (3,032 mi). It is about 0.38 times the size of Earth.

Our solar system is huge. There is a lot of empty space out there between the planets. Voyager 1, the most distant human-made object, has been in space for more than 40 years and it still has not escaped the influence of our Sun. As of Feb. 1, 2020, Voyager 1 is about 13.8 billion miles (22.2 billion kilometers) from the Sun -- nearly four times the average ...

The size of each planets in the solar system The Sun, the 8 official planets in our solar system (Mercury, Venus, Earth, Mars, Jupiter, Saturn, Uranus and Neptune) and the dwarf planet Pluto, are each entirely unique

# Planets in solar system by size

in their orbiting patterns, colouring, size, mass, and composition. Given the uniqueness of each planet (and star), we can make ...

6. Calculate combined scale distance and planet size. If you are interested in a more accurate way to represent the solar system and have a lot of space (at least half a mile!) to work with, try making a model of the solar system that displays distance and planet size at the same scale. Otherwise, skip this step. Steps:

The largest planet in the solar system is Jupiter, followed by Saturn, Uranus, Neptune, Earth, Venus, Mars with the smallest being Mercury. The table below shows the size of the planet, how far it is from the Sun and how long it takes to complete a single orbit. Name Diameter Distance from Sun Length of Year: Mercury: 4,879 km: 57,909,227 km ...

The largest planet in our solar system by far is Jupiter, which beats out all the other planets in both mass and volume. Jupiter's mass is more than 300 times that of Earth, and its diameter, at 140,000 km, is about 11 times Earth's diameter.

Biggest To Smallest. Here you can learn about the 30 largest moons (by diameter) in the solar system! There are over 180 moons that orbit the planets and dwarf planets. The largest 19 moons in the list below are large enough to have been rounded by their own gravity (this is called being in hydrostatic equilibrium). If these moons were directly orbiting the Sun, that'd be referred to as ...

Be big enough that its gravity cleared away any other objects of similar size near its orbit around the Sun. Dwarf planets like Pluto were defined as objects that orbit the Sun, ... Pluto was long considered our solar system's ninth planet. But after other astronomers found similar intriguing worlds deeper in the distant Kuiper Belt - the IAU ...

For example, if you order the planets by size (radius) from biggest to smallest, then the list would be: Advertisement. The Planets in Order by Size. Jupiter (43,441 miles/69,911 kilometers) Saturn (36,184 miles/58,232 km) ... Pluto is one of five dwarf planets in our solar system - and it's not even the largest one (that's Eris). ...

Solar System Sizes and Distances Distance from the Sun to planets in astronomical units (au): Planet Distance from Sun (au) Mercury 0.39 Venus 0.72 Earth 1 Mars 1.52 Jupiter 5.2 Saturn 9.54 Uranus 19.2 Neptune 30.06 Diameter of planets and their distance from the Sun in kilometers (km): Planet Diameter (km) Distance from Sun (km) ...

Compare the Planets. Our Solar System has eight planets. Four of these are Giants: Jupiter, Saturn, Neptune, Uranus. Did you know if you try to stand on Jupiter you would sink right through as it is made out of gas? Did you know Saturn is 95 times more massive than Earth? Compare Planets, Moons and other objects side-by-side in this 3D live ...

# Planets in solar system by size

What if the planets were ordered by SIZE? - Part 1 (also known as The Solar System Organized by Size on Patreon) is the 84th episode by air date and 92nd episode by chronological order of SolarBalls. The Sun has a crazy idea: what if the planets were ordered by size? The answer? PURE CHAOS!!! The episode starts with Mercury playing cards with Earth, Mars, and Venus. ...

The Solar System is the system of objects that orbit the Sun directly or indirectly. A celestial body is called a planet in the Solar System if it orbits the Sun, if it is heavy enough for gravity to squeeze it into a spherical shape, and if it has "cleared the neighborhood" around its orbit.

How to Use the Planet Size Comparison Chart. Click on a planet or the Sun for details on composition, mass, gravity, and number of moons. You can also zoom in and out on the planets or the Sun using the plus and minus buttons. Change between km / mi in settings; Use the buttons at the top to sort the planets by their order from the Sun or by ...

Jupiter is a massive planet, twice the size of all other planets combined, and has a centuries-old storm that is bigger than Earth. ... The Sun is the heart of our solar system and its gravity is what keeps every planet and particle in orbit. This yellow dwarf star is just one of billions like it across the Milky Way galaxy.

5 days ago#0183; The solar system's several billion comets are found mainly in two distinct reservoirs. The more-distant one, called the Oort cloud, is a spherical shell surrounding the solar system at a distance of approximately 50,000 astronomical units (AU)--more than 1,000 times the distance of Pluto's orbit. The other reservoir, the Kuiper belt, is a thick disk-shaped zone whose main ...

A star that hosts planets orbiting around it is called a planetary system, or a stellar system, if more than two stars are present. Our planetary system is called the Solar System, referencing the name of our Sun, and it hosts eight planets.. The eight planets in our Solar System, in order from the Sun, are the four terrestrial planets Mercury, Venus, Earth, and ...

The solar system has two main types of planets. The inner planets--Mercury, Venus, Earth, and Mars--have rocky compositions. In contrast, the four outer planets, also called the Jovian, or giant, planets--Jupiter, Saturn, Uranus, and Neptune--are large objects that are composed primarily of hydrogen

Size and Order of the Planets. September 14, 2012 Chris Blog. This graphic shows off the relative sizes of the major bodies in the solar system and the order of the planets. It was originally intended truly show off the scale of the solar system however that would have meant were the distance from the Sun to Pluto 2,000 pixels the Sun would 5 ...
