Should lithium-ion batteries be recycled?

American regulators are looking to implement recycling standards for lithium-ion batteries to reduce waste, poor labor conditions, and pollution. Lithium batteries are everywhere: They're used in everything from headphones and small appliances to electric vehicles and energy storage facilities.

What is lithium-ion battery recycling?

It does not require chemicals or heat and allows scientists to recover more lithium from spent batteries than other recycling methods. According to Ikenna Nlebedim, a scientist at Ames Lab and leader of the research team, the three typical methods for lithium-ion battery recycling are hydrometallurgical, pyrometallurgical, and direct recycling.

What is reuse & repurposing a lithium-ion battery?

Reuse and repurposing are two similar, environmentally friendly alternatives to recycling or disposal of a lithium-ion battery that no longer meets its user's needs or is otherwise being discarded. Battery performance degrades over time, but used batteries can still provide useful energy storage for other applications.

How do you recycle a lithium ion battery?

Typical methods for recycling these batteries require harsh liquid chemicals or heat to complete the process. These processes can produce toxic byproducts and require large amounts of energy. Process overview, left to right: Fast charge of the lithium-ion battery. Disassemble battery into individual parts. Place components in water and add CO<sub>2</sub>.

How to recycle Li-ion battery active materials?

Typical direct, pyrometallurgical, and hydrometallurgical recycling methods for recovery of Li-ion battery active materials. From top to bottom, these techniques are used by OnTo, (15) Umicore, (20) and Recupyl (21) in their recycling processes (some steps have been omitted for brevity).

Are lithium-ion batteries ethical?

While lithium-ion batteries are crucial for powering everything from cell phones to electric vehicles, the extraction of key battery components like lithium and cobalt comes with significant environmental and ethical costs.

Despite their wide use, it is estimated that only 5% of lithium batteries are currently recycled. Because lithium has high supply risk, discarded batteries are a potential source for recovering lithium. Scientists are developing improved ways to recycle and recover some of ...

With the rapid development of the electric vehicle industry in recent years, the use of lithium batteries is growing rapidly. From 2015 to 2040, the production of lithium-ion batteries for electric vehicles could reach 0.33 to 4 million tons. It is predicted that a total of 21 million end-of-life lithium battery packs will be generated between 2015 and 2040. Spent lithium batteries can ...

Due to the high investment costs, pyrometallurgical treatment, for example, is primarily suitable for the recycling of batteries with high cobalt and nickel content, such as LCO, NMC, and NCA batteries. Lithium and aluminum end up in a slag and can only be recovered with considerable additional effort.

3. Waste lithium-ion battery and pre-treatment 3.1 Waste lithium-ion batteries Research on lithium recycling has focused mainly on discarded lithium-ion batteries. Lithium-ion batteries function by the movement of Li<sup>+</sup> ions and electrons, and they consist of an anode, cathode, electrolyte, and separator. The cathode, depending on its

Recycling researchers, meanwhile, say effective battery recycling will require more than just technological advances. The high cost of transporting combustible items long distances or across borders can ...

The Methods of Recovering Lithium Ion Batteries. Recycling for LIBs usually involves both physical and chemical processes (Harper et al., 2019). Due to the complex assembly process of LIBs and the wide variety of electrodes, it brings great danger for the recovery of battery. The explosion, combustion and poisonous gas brought on the recovery ...

The Safety Advisory Notice aims to increase the public's overall awareness about the dangers related to shipping lithium batteries for recycling or disposal. The Safety Advisory Notice: Highlights the essential hazmat regulatory information needed to ship lithium batteries in commercial transportation for recycling and disposal.

Recycling lithium from spent batteries is challenging because of problems with poor purity and contamination. Here, we propose a green and sustainable lithium recovery strategy for spent batteries containing LiFePO<sub>4</sub>, LiCoO<sub>2</sub>, and LiNi<sub>0.5</sub>Co<sub>0.2</sub>Mn<sub>0.3</sub>O<sub>2</sub> electrodes. Lithium and several other metals that make up these batteries are incredibly valuable. The cost of raw lithium is roughly seven times what you'd pay for the same weight in lead, but unlike lithium batteries, almost all lead-acid batteries get recycled. So there's something beyond pure economics at play.

Efficient extraction of electrode components from recycled lithium-ion batteries (LIBs) and their high-value applications are critical for the sustainable and eco-friendly utilization of resources. This work demonstrates a novel approach to stripping graphite anodes embedded with Li<sup>+</sup> from spent LIBs directly in anhydrous ethanol, which can be utilized as high efficiency ...
