How do battery energy storage systems work? Simply put, utility-scale battery storage systems work by storing energy in rechargeable batteries and releasing it into the grid at a later time to deliver electricity or other grid services. Without energy storage, electricity must be produced and consumed at exactly the same time.

The world's largest battery energy storage system so far is Moss Landing Energy Storage Facility in California. The first 300-megawatt lithium-ion battery - comprising 4,500 stacked battery racks - became operational at the facility in January 2021.

Although using energy storage is never 100% efficient--some energy is always lost in converting energy and retrieving it--storage allows the flexible use of energy at different times from when it was generated. So,

storage can increase system efficiency and resilience, and it can improve power quality by matching supply and demand.
