Abstract. Among the available energy storage technologies, pumped thermal energy storage (PTES) is emerging as a potential solution for large-scale electrical energy storage with high round-trip efficiencies and no geographical limitations. However, PTES requires a low-cost, high-temperature heat source to achieve reasonable round-trip efficiencies. Moreover, ...

The thermal energy generated by the compression process releases into the atmosphere. Accordingly, an external heat source is required during the expansion process to prevent the condensation or freezing in the gas turbines. The A-CAES without thermal energy storage (TES) is proposed to avoid the use of an external heat source [27].

The final result would be a conversion of heat into work at constant temperature--a violation of the first (Kelvin) form of the second law. The concept of entropy was first introduced in 1850 by Clausius as a precise mathematical way of testing whether the second law of thermodynamics is violated by a particular process.
