How do I import an IDF file into Ansys IcePak?

Purge Inactive Objects option in the IDF Import dialog box. See Reading an IDF File Into ANSYS Icepak of the User's Guide. Transient setup of models is now possible using CSV files. This capability enables import/export of all transient parameters including piecewise linear property curves using CSV files.

How can I run multiphysics simulations using IcePak?

Run multiphysics simulations by coupling Icepak with AEDT electromagnetics solvers(Maxwell,HFSS,Q3D). How and where to get additional resources and support. Training materials for this course are available with a Ansys Learning Hub Subscription. If there is no active public schedule available,private training can be arranged.

How can I improve the performance of IcePak?

Make sure your computer has enough memory (RAM) and fast storage to handle the workload. If you need more help,consult the software documentation or contact the support team. By following these steps,you can optimize the use of multiple coresand improve performance during post-processing and data collation in both classic Icepak and AEDT Icepak.

How to use multiple processors in IcePak?

For the classic Icepak we just need to specify the number of processors in Solution settings-&parallel settings panel. As you have observed,the parallel processors are used by fluent to solve using the multiple processors. For loading and post processing it uses one processor. Please check the document or training material for details.

How do I transfer thermal results from IcePak to mechanical IcePak?

Thermal Results from Icepak to Mechanical Icepak results can be transferred to the following analysis types within Workbench: Static Structural, Steady-State Thermal, Transient Structural, or Transient Thermal. To add an analysis type:

How do I create a project in IcePak?

To launch the Icepak application, double-click the Icepak cell. A new project is created in the name of the project cell. If a DesignModeler system is used the geometry is imported into Icepak automatically. Otherwise, the geometry must be created in Icepak using Icepak primitive objects.

The utilization of paraffin in the latent thermal energy storage (LTES) system for solar energy storage is hampered by its low thermal conductivity. Paraffin/nickel foam and paraffin/copper foam composite phase change materials (PCMs) were prepared using a vacuum impregnation method in the present study.

With the rapid developments in the industry and technology, the energy need is increasing. 80% of the CO<sub>2</sub> emission in the atmosphere is caused by the use of fossil based fuel and this situation has a serious impact on climate change. Therefore, energy researchers/engineers mainly work on the development and improvement of the techniques in ...

Decarbonizing our carbon-constrained energy economy requires massive increase in renewable power as the primary electricity source. However, deficiencies in energy storage continue to slow down rapid integration of renewables into the electric grid. Currently, global electrical storage capacity stands at an insufficiently low level of only 800 GWh, ...

This video shows how to change existing material properties for each layer of an Electrical CAD (ECAD) design in ANSYS Icepak. The demo board has multiple layers and vias. From the materials available in the Icepak database, the existing trace materials for each layer of the PCB is modified. The video also shows how to [...]

The conventional vehicle widely operates using an internal combustion engine (ICE) because of its well-engineered and performance, consumes fossil fuels (i.e., diesel and petrol) and releases gases such as hydrocarbons, nitrogen oxides, carbon monoxides, etc. (Lu et al., 2013).The transportation sector is one of the leading contributors to the greenhouse gas ...

1. Introduction. Today, the most difficult challenge faced by the humanity is the global energy for the future. Our anxiety about our environment, limited natural sources, energy storage problems, environmental risks, natural calamities lead to increasing responsiveness towards the status of extraordinary performance of the sustainable energy materials, their ...

Phase change materials (PCMs) have attracted tremendous attention in the field of thermal energy storage owing to the large energy storage density when going through the isothermal phase transition process, and the functional PCMs have been deeply explored for the applications of solar/electro-thermal energy storage, waste heat storage and utilization, ...

Ice Bear 20 combines Ice Energy's patented thermal storage technology with integrated cooling to shift your electricity usage away from high Time of Use (TOU) rate periods. When dispatched to provide cooling, it turns its compressor off and uses the stored ice, frozen during off-hour electricity rates, to cool your home for up to 8 hours ...

The shortage of fossil fuel is a serious problem all over the world. Hence, many technologies and methods are proposed to make the usage of renewable energy more effective, such as the material preparation for high-efficiency photovoltaic [1] and optimization of air foil [2]. There is another, and much simpler way to improve the utilization efficiency of renewable ...

The four main classes of PCMs based on material type are organic, inorganic, eutectics and composites. Organic PCMs are preferably used for low temperature applications, eutectics for intermediate and inorganic for high temperature applications [11] posites are added to enhance the thermal conductivity of PCMs [12]. Encapsulation techniques for PCMs ...

Sensible thermal energy storage (STES) technology is the most widely used and only commercialized energy storage technology in large-scale applications [1]. The most widely used currently STES technology is the dual-tank molten salt TES technology [2]. However, molten salt faces challenges such as high cost, limited operating temperature, high ...

Cold thermal energy storage (CTES) based on phase change materials (PCMs) has shown great promise in numerous energy-related applications. Due to its high energy storage density, CTES is able to balance the existing energy supply and demand imbalance. Given the rapidly growing demand for cold energy, the storage of hot and cold energy is emerging as a ...

Solar energy is a renewable energy source that can be utilized for different applications in today's world. The effective use of solar energy requires a storage medium that can facilitate the storage of excess energy, and then supply this stored energy when it is needed. An effective method of storing thermal energy from solar is through the use of phase change ...

Introduction to Thermal Energy Storage. Passive processes for thermal energy storage have received a lot of attention in the past 25 years. These passive thermal energy storage materials can typically be divided into two parts, specific and latent. This paper will primarily focus on the concept of latent heat.

Although the large latent heat of pure PCMs enables the storage of thermal energy, the cooling capacity and storage efficiency are limited by the relatively low thermal conductivity ( $\sim 1 \text{ W/(m} \cdot \text{K)}$ ) when compared to metals ( $\sim 100 \text{ W/(m} \cdot \text{K)}$ ). 8, 9 To achieve both high energy density and cooling capacity, PCMs having both high latent heat and high thermal ...

PCMs have an infinite number of applications for inactive as well as adaptive heating/cooling as a combined portion of the cascaded thermal energy structure (TES) [8]. There are a significant number of PCM applications like building applications, daily life applications, production of energy storage systems, thermal battery control, space applications, thermal ...

The total energy consumption for an ice thermal storage system will be much higher than without storage due to losses which are much higher than with battery storage (based on studies I found a while ago - unfortunately I didn't save the links), so even with zero installation cost, it only makes economic sense for the homeowner when either there is a large cost ...

The TSU-M ICE CHILLER™; Thermal Storage Unit reduces energy costs by storing cooling while shifting energy usage to off-peak hours. The internal melt process has an easy-to-design closed loop making it ideal for a variety of HVAC applications. ... Some examples include office buildings, district cooling for urban settings, schools, hospitals ...

Thermal energy storage (TES) is a technology that reserves thermal energy by heating or cooling a storage medium and then uses the stored energy later for electricity generation using a heat engine cycle (Sarbu and Sebarchievici, 2018) can shift the electrical loads, which indicates its ability to operate in demand-side management (Fernandes et al., 2012).

The article presents different methods of thermal energy storage including sensible heat storage, latent heat storage and thermochemical energy storage, focusing mainly on phase change materials (PCMs) as a form of suitable solution for energy utilisation to fill the gap between demand and supply to improve the energy efficiency of a system.
