

Porous Silicon (PS) freestanding film is a derivative of single crystal Si wafer. PS films obtained on electrochemical etching of p-type silicon (Si) wafer were used to synthesize Si nanoparticles by ultrasonication. 12 mm thick and 29% porous freestanding PS films were sonicated for 4 h in 120 W ultrasonication bath at 42 kHz. One of the hydrogen storage materials that is close to meeting the performance targets is the MOFs [Citation 2, Citation 3], whose crystalline frameworks with open structures and internal cavities can potentially accommodate and store large amounts of molecular hydrogen. Since surface area is qualitatively proportional to hydrogen gas uptake, molecular ...

The purpose of this review is to summarize the characterization and properties of porous silicon (PS) for hydrogen storage. In silicon porosification technology, the importance of hydrogen as an intermediate product is highlighted. In this respect, this study explored what hydrogen bonding in PS is like and how it can be used to store hydrogen. The comprehension ...

On-demand hydrogen generation is desired for fuel cells, energy storage, and clean energy applications. Silicon nanowires (SiNWs) and nanoparticles (SiNPs) have been reported to generate hydrogen by reacting with water, but these processes usually require external assistance, such as light, electricity or catalysts.

Herein, we demonstrate that a porous ...

The theoretical maximal hydrogen content of silicon hydride SiH , SiH_2 and SiH_3 is 3.44, 6.66 and 9.67 wt%, respectively [23]. Silicon nanostructures, such as silicon nanotubes [24-26], porous silicon [27-29], silicon clathrates [30-32], silicon carbide nanotubes [33-36], silicon clusters [37-39], and metals decorated silicon clusters [40,41] have been proved to be ...

Lithium (Li) is a popular light energy storage material with a maximum theoretical energy density of $\sim 2 \text{ kW h kg}^{-1}$ and 1 kW h L^{-1} . 6,7 Li and hydrogen form light metal hydrides with an equivalent energy density of $\sim 5 \text{ kW h kg}^{-1}$ and 3.9 kW h L^{-1} . 8 Releasing hydrogen from LiH requires high temperatures ($\sim 900 \text{ }^\circ\text{C}$ for 0.1 MPa), 9 posing a significant challenge for ...

In our previous article, we shared an overview of liquid hydrogen carriers (LHCs) and their role in the rapid adoption of hydrogen as a fuel. Liquid organic hydrogen carriers (LOHCs) are currently the popular choice for storing and transporting H_2 . However, these carriers eventually degrade over time in the form of carbon emissions. Recently, silicon-based carriers, ...

Hydrogen storage using metal hydride has been studied for a long time and is a relatively mature technology. However, metal hydrides are usually heavy, and some are very stable compounds and require high dehydrogenation temperature of more than $300 \text{ }^\circ\text{C}$ [7, 8]. Metal-organic frameworks (MOFs) are an example of solid-state porous material that can be ...
