Distributed energy system could be defined as small-scale energy generation units (structure), at or near the point of use, where the users are the producers--whether individuals, small businesses and/or local communities. These production units could be stand-alone or could be connected to nearby others through a network to share, i.e. to share the ...

With the increased use of renewable energy sources and micro-grid networks, there is very limited work related to the development of small-scale cryogenic energy storage technology for local power generation applications. Cryogenic energy storage technology offers advantages of relatively large volumetric energy density and ease of storage.

control on renewable energy generation makes distributed energy storage a necessary prerequisite for the wider deployment of renewable energy systems and their deeper penetration into utilities" portfolios. Thermodynamic energy storage in the form of compressed air can be applied at small scales as an alternative to electrical batteries.

Energy storage systems are applied in response to intermittence and to use the solar source in suitable periods []. The use of energy storage systems increases energy reliability and security, supports greater integration of
