Renewable energy systems require energy storage, and TES is used for heating and cooling applications [53]. Unlike photovoltaic units, solar systems predominantly harness the Sun's thermal energy and have distinct efficiencies. However, they rely on a radiation source for thermal support. TES systems primarily store sensible and latent heat.

The model that is widely used in the literature is the "Double Polarization Model". The equivalent electrical circuit is shown in Fig. 7.1. The model captures the two distinct chemical processes within the battery, namely separation polarization and electrochemical polarization (the short-term and the long-term dynamics, respectively).
