

The potential benefit of energy storage integration with wind power

Why is integrating wind power with energy storage technologies important?

Volume 10, Issue 9, 15 May 2024, e30466 Integrating wind power with energy storage technologies is crucial for frequency regulation in modern power systems, ensuring the reliable and cost-effective operation of power systems while promoting the widespread adoption of renewable energy sources.

Why are energy storage systems used in wind farms?

As mentioned, due to the intermittent nature of wind speed, the generated power of the wind energy generation systems is variable. Therefore, energy storage systems are used to smooth the fluctuations of wind farm output power.

What are the challenges faced by wind energy storage systems?

Energy storage systems in wind turbines With the rapid growth in wind energy deployment, power system operations have confronted various challenges with high penetration levels of wind energy such as voltage and frequency control, power quality, low-voltage ride-through, reliability, stability, wind power prediction, security, and power management.

Can integrated energy storage system generate more revenue than wind-only generation?

The integrated system can produce additional revenue compared with wind-only generation. The challenge is how much the optimal capacity of energy storage system should be installed for a renewable generation. Electricity price arbitrage was considered as an effective way to generate benefits when connecting to wind generation and grid.

Can energy storage control wind power & energy storage?

As of recently, there is not much research done on how to configure energy storage capacity and control wind power and energy storage to help with frequency regulation. Energy storage, like wind turbines, has the potential to regulate system frequency via extra differential droop control.

How a wind-storage coupled system can increase the initial investment?

When integrating the energy storage plant, it stores the wind power when the electricity price is low, and releases it when the price is high. The total income of the wind-storage coupled system can be significantly increased. However, it will increase the initial investment by adding energy storage system.

Power grids will need to expand to meet the increasing demand for electricity and renewable energy: to achieve net-zero emissions by 2050, countries would need to double their investment in transmission lines and other infrastructure to EUR550 billion per year by 2030. 4 Electricity grids and secure energy transitions, IEA, November 2023.
