Storing renewable energy to charge equipment is also possible with energy storage solutions. BESS can integrate with green energy generators like wind and solar. During periods of high power production, BESS store the excess energy. Then, during periods of low irradiance or wind, the stored energy powers the required equipment.

As part of the clean energy transition, low-carbon renewable energy sources such as solar and wind are being rapidly deployed on the electric grid. However, because these generation sources are variable, grid-scale energy storage is needed to help balance energy supply and demand.

1. Introduction. In order to mitigate the current global energy demand and environmental challenges associated with the use of fossil fuels, there is a need for better energy alternatives and robust energy storage systems that will accelerate decarbonization journey and reduce greenhouse gas emissions and inspire energy independence in the future.

performed with the energy storage deployed in the system. For the example of meeting a frequency nadir specification after a contingency, not deploying energy storage might result in a higher probability of under-frequency load shedding and damage to equipment. Deploying energy storage might virtually eliminate these potential costs. The
