4.1. Energy storage state analysis. When the DC bus voltage U_B is greater than the set upper limit U_{Bmax} , the regulator G_{B1} is saturated, and the output I_{B1} is the maximum value $I_1 + I_2$ ("+" represents energy storage, and "-" represents energy release); the regulator G_{B2} is saturated, and the output I_{B2} is the maximum value of ...

Ultrafast charge/discharge process and ultrahigh power density enable dielectrics essential components in modern electrical and electronic devices, especially in pulse power systems. However, in recent years, the energy storage performances of present dielectrics are increasingly unable to satisfy the growing demand for miniaturization and integration, ...

The discharged energy-storage density (W_D) can also be directly detected by charge-discharge measurements using a specific circuit. The capacitor is first charged by external bias, and then, through a high-speed and high-voltage switch, the stored energy is discharged to a load resistor (R_L) in series with the capacitor. The current passed through the resistor $I(t)$ or ...
