How can generative design optimize the position of a tower crane?

This research, therefore, aims to optimize the position of a tower crane by maximizing its lift ability. To achieve the goals, generative design, a paradigm that integrates the constructive features of mathematical and visual optimization techniques, is used to develop a relatively comprehensible prototype.

What are the four primary gravity energy storage forms?

This paper conducts a comparative analysis of four primary gravity energy storage forms in terms of technical principles, application practices, and potentials. These forms include Tower Gravity Energy Storage (TGES), Mountain Gravity Energy Storage (MGES), Advanced Rail Energy Storage (ARES), and Shaft Gravity Energy Storage (SGES).

Does railway construction increase energy storage density?

However, the models above have higher costs and slightly lower energy storage density. The construction of railway tracks increases costs, so the Austrian International Research Institute (IIASA) proposed a MGES model in 2019, with specific parameters shown in Table 3.

How to increase the power capacity of a crane?

The rate of descent or ascent can be adjusted based on output requirements, and increasing the mass or speed is advantageous for enhancing the system's power capacity. However, an increase in the mass of the bricks can lead to a rise in the capital expenditure of the crane.

Can rail-type gravity energy storage replace pumped storage?

In mountainous regions with suitable track laying and a certain slope, rail-type gravity energy storage exhibits significant development potential and can essentially replace pumped storage. SGES facilitates the reuse of abandoned mines.

What are the different types of gravity energy storage?

These forms include Tower Gravity Energy Storage (TGES), Mountain Gravity Energy Storage (MGES), Advanced Rail Energy Storage (ARES), and Shaft Gravity Energy Storage (SGES). The advantages and disadvantages of each technology are analyzed to provide insights for the development of gravity energy storage.

Medium size cranes are designed to perform in demanding job sites, using the standard 1.75 x 1.75 metre tower systems for the smaller models and the 2.16 x 2.16 metre tower sections for the larger crane models. Combining different standard tower systems these cranes can reach awesome free-standing heights of over 86 metres. See Specifications

Read about how the tower stacks up against other energy storage concepts ... At 35 metric tonnes/block that works out to 77,000 lbs. Tower cranes for building construction are 200-250 ft high so a single block lowered to the ground from that height would generate 7.25 kWhr. ... & Security Technology Display Technologies Electrical Components ...

The schematic diagram of a tower crane is shown in Fig. 1. The jib is capable to rotate around the mast, while the trolley can traverse along the jib. With the help of a tower crane, an operator can place an object anywhere in a three-dimensional space by controlling jib slew motion, trolley translational motion and hoisting operation.

PurposeThe site layout has a significant impact on the efficiency of construction operations. Planning an effective site layout partly involves identifying and positioning temporary facilities such as tower cranes and areas on the jobsite for materials storage. This study proposes an approach to optimizing the type and location of the tower crane and material supply point ...

Two kinds of S-CO₂ Brayton cycle tower solar thermal power generation systems using compressed CO₂ energy storage are designed in this paper. The energy storage system uses excess solar energy to compress CO₂ near the critical point to a high-pressure state for energy storage during the day, and the high-pressure CO₂ is heated by a gas-fired boiler ...

The X3L Tower Crane Camera System is designed to be easy and quick to install. It can be fitted in minutes, giving you the sight and sounds from the crane hook. ... specification, aesthetics and 71mm low profile design make this a must for all crane operations. SIZE & WEIGHT - HEIGHT: 128mm (5.04 in) WIDTH: 170mm (6.69 in) DEPTH: 71mm (2.8 in ...

The tower crane utilised for the experimental verifications consists of a mast fitted with a jib, a trolley, a cable with a hoisting mechanism and a payload. Fig. 4 shows the laboratory tower crane and the important parts are labelled. The crane dimensions are 1.2 m × 1.2 m × 1.5 m for the length, height and width respectively.

Unlike their static tower cranes that are tied to a single location, travelling tower cranes move along horizontal tracks. These tracks provide a stable platform for the crane's heavy-duty bogies. This unique setup grants travelling cranes the freedom to roam, easily covering expansive areas in a construction site.

The majority of the under-actuated tower crane work in literature addresses payload swing suppression as a closed-loop control problem. Vaughan et al. have reviewed a command generation technique to suppress the oscillatory dynamics of double-pendulum tower cranes, with robustness to frequency changes. However, only the trolley motion is ...

Tower cranes are traditionally removed by other cranes. Component are taken apart one piece at a time starting with the hook, cables and counterweight which is followed closely by the jib, cab and tower. ... Depending upon what your tower crane will be used for you may require a different model or design. If your crane will be lifting things ...

The structure of this paper is as follows: Firstly, the nonlinear dynamic model of a tower crane with double-pendulum effect is established and the control objective is clearly specified. Then, an adaptive tracking controller is designed, and the stability of the closed-loop system is analyzed theoretically by Lyapunov technique and LaSalle's ...

To tackle the control problem of tower cranes when the cable length is varying, the dynamic model of tower cranes with varying cable lengths is established in this paper. Then, an adaptive sway reduction control method is proposed based on the original nonlinear dynamic model, where parametric uncertainties are present.

There are many open-loop control methods for tower cranes. In [6], a novel command shaping scheme was designed for reducing vibration of tower cranes [7], a kinematic coupling-based trajectory planning method was discussed for overhead cranes. To solve the load twisting, [8] designed an open-loop controller. [9] proposed a trajectory planning control method for double ...

The dynamic model of the tower crane is very complicated. We consider the effect of various factors on pay-load swing. When constructing the tower crane dynamics model, this article made the following five assumptions in Table 1. In the three-dimensional model of the tower crane system, Table 2 shows the system parameters.

As representative underactuated systems, tower cranes exhibit high nonlinearity and strong state coupling, which makes their controller design (analysis) challenging and of great research values. In addition, since tower cranes are widely applied in outdoor environment with inevitable external disturbances, (the state variables tend to go far away from the equilibrium ...

Based on the developed 5-DOF tower crane model, an improved non-singular fast terminal sliding mode control (INFTSMC) scheme is proposed to achieve the finite-time convergence of the closed-loop system, accurate payload positioning and effective swing suppression in the presence of unknown payload masses, frictions and wind disturbances.

In 2019, Energy Vault, a Swiss company [26], deployed an energy storage tower system (outlined in Table 1). The tower, with a height of up to 120 m, features a central tower body equipped with six lifting arms capable of handling concrete bricks weighing up to 35 t. These bricks are stacked and dismantled to create the energy storage tower.

The control system of tower crane exhibits strong nonlinearity in the process of control execution, which is prone to the problems of inaccurate positioning control of the payload and difficult anti-swing control. Aiming at the problems, this paper proposes a control law based on improved energy coupling analysis for suppressing the payload swing in the tower cranes. ...
