What are the different types of energy storage devices?

There are different ways to store energy: chemical, biological, electrochemical, electrical, mechanical, thermal, and fuel conversion storage. This chapter focuses on electrochemical energy storage and conversion. Traditionally, batteries, flow batteries, and fuel cells are considered as electrochemical energy storage devices.

What are electrochemical energy storage/conversion systems?

Electrochemical energy storage/conversion systems include batteries and ECs. Despite the difference in energy storage and conversion mechanisms of these systems, the common electrochemical feature is that the reactions occur at the phase boundary of the electrode/electrolyte interface near the two electrodes.

What technology is used for energy storage?

The last-presented technology used for energy storage is electrochemical energy storage, to which further part of this paper will be devoted. Electrochemical energy storage is one of the most popular solutions widely used in various industries, and the development of technologies related to it is very dynamic.

Can electrical energy be stored electrochemically?

Electrical energy can be stored electrochemically in batteries and capacitors. Batteries are mature energy storage devices with high energy densities and high voltages.

Electrochemistry supports both options: in supercapacitors (SCs) of the electrochemical double layer type (see Chap. 7), mode 1 is operating; in a secondary battery or redox flow battery (see Chap. 21), mode 2 most systems for electrochemical energy storage (EES), the device (a battery, a supercapacitor) for both conversion processes is the same.
