The wind farm as a power plant. One single wind turbine can generate a few megawatts (MW) of power. That's a lot compared to the power needed to light a home, for example. But it's still much less than the steam turbine in a conventional power station. That's why wind turbines are grouped together to form a wind farm.

MITEI's three-year Future of Energy Storage study explored the role that energy storage can play in fighting climate change and in the global adoption of clean energy grids. The Eq. (6.2) is already a useful formula - if we know how big is the area A to which the wind "delivers" its power. For example, is the rotor of a wind turbine is (R) , then the area in question is $(A=\pi R^2)$. Sometimes, however, we want to know only how much power the wind carries per a unit surface area - denote it as (p) .

Advantages of Wind Power. Wind power creates good-paying jobs. There are nearly 150,000 people working in the U.S. wind industry across all 50 states, and that number continues to grow. According to the U.S. Bureau of Labor Statistics, wind turbine service technicians are the fastest growing U.S. job of the decade. Offering career opportunities ranging from blade fabricator to ...
