The region also aims to come up with a hydrogen and energy storage industry chain, making clean energy a new growth area in the region, he said. The expo will bring new opportunities for the region's energy industry, especially the clean energy sector, with cooperation between the two sides entering a new era.

The extraordinary energy storage capability of V₂C MXenes is often connected with the energy storage mechanisms which is related with its heterostructures nature, a very important property for realizing actual high energy density solid-state supercapacitor. This heterostructure helps in finding new strategies for preparing MXene electrodes ...

Due to high power density, fast charge/discharge speed, and high reliability, dielectric capacitors are widely used in pulsed power systems and power electronic systems. However, compared with other energy storage devices such as batteries and supercapacitors, the energy storage density of dielectric capacitors is low, which

results in the huge system volume when applied in pulse ...

Biomass materials have received extensive attention for energy-storage due to low cost and specific structures. Here, a cost-effective carbonaceous material is prepared from biomass corn pod which is commonly considered as a waste, then CuCo_2O_4 nanowires are in-situ grown on the surface to form a three-dimensional free-standing electrode for several types ...

Since Sep. 2017, he is a Professor at Anhui Normal University. His research interests are about the synthesis and properties of nanomaterials with focuses on materials with unique energy-storage, electrochemical, and sensing properties and their applications in secondary batteries, sensors, etc.

Research on phase change material (PCM) for thermal energy storage is playing a significant role in energy management industry. However, some hurdles during the storage of energy have been perceived such as less thermal conductivity, leakage of PCM during phase transition, flammability, and insufficient mechanical properties. For overcoming such obstacle, ...

There are three main types of MES systems for mechanical energy storage: pumped hydro energy storage (PHES), compressed air energy storage (CAES), and flywheel energy storage (FES). Each system uses a different method to store energy, such as PHES to store energy in the case of GES, to store energy in the case of gravity energy stock, to store ...

Nanofillers can significantly enhance or modify the different properties of the materials into which they are incorporated, such as the energy storage properties. Graphene is a suitable nanofiller in improving material properties such as physical, mechanical, and energy storage [22] (Table 9.1, Table 9.2).

Even though each thermal energy source has its specific context, TES is a critical function that enables energy conservation across all main thermal energy sources [5] Europe, it has been predicted that over 1.4×10^{15} Wh/year can be stored, and 4×10^{11} kg of CO_2 releases are prevented in buildings and manufacturing areas by extensive usage of heat and ...

Typically, lithium-sulfur batteries (LSBs) are selected as ideal choices for energy storage systems due to their high theoretical-specific capacity (1,672 mA h/g) and theoretical-specific energy density (2,600 W h/kg), which is five times higher than traditional lithium-ion batteries (LIBs) (Dai et al., 2021; Zhou et al., 2021; Zhu et al., 2022).
